The word probability has several meanings in ordinary conversation. Two of these are particularly important for the development and applications of the mathematical theory of probability. One is the interpretation of probabilities as relative frequencies, for which simple games involving coins, cards, dice, and roulette wheels provide examples.

This talk will be concerned with two problems. The first is the zeros of the derivatives of. Kac random polynomials  $K_n$ , which is a random polynomial with i.i.d. coefficients. It has been shown that the empirical measure of zeros of  $K_n$  will converge to the uniform measure on the unit circle of complex plane.
