In order to test the population and growth of the two species of Paramecium, samples of each species were placed in a culture for 16 days. Each species was tested separately as well as combined with the other. By observing the slides and cultures every two days, students were able to see the growth in the population of the paramecium.

Virtual Lab: Population Biology - Google Docs

natural predation would keep the deer population from becoming too large and also increase the deer quality (or health), as predators often eliminate the weaker members of the herd. In 1971, ten wolves were flown into the island. The results of this program are shown in the following table. The Population Change is the

Deer: Predation or Starvation

Purpose: St. Matthew Island, located near Alaska, had a population of reindeer introduced in 1944. The population exploded, as the island had no predators or other factors to slow their growth rate. Over time, the deer used up the resources of the island, eventually experiencing a severe dieback due to the lack of food.
